

Kaspersky Internet Security for Mac - Features

Protecting you from Mac malware... and more

Because so much malware is now targeting the Mac operating system - and Macs can also be used to spread PC virus infections - Kaspersky Internet Security for Mac has been developed to do much more than just provide Mac antivirus capabilities:

- o Protects your Mac against all types of new and emerging malware threats - including computer viruses, worms, Trojans, bots, spyware and more
- o Prevents your Mac from passing on PC and Linux malware to your family's, friends' or colleagues' PCs

Securing you against Internet security threats

Whichever type of computer you use to access the Internet... it's the same Internet - with all the same web-based threats. When it comes to sophisticated phishing attacks - that try to acquire users' passwords, credit card details and more - Macs are just as vulnerable as other computers. To protect you, Kaspersky Internet Security for Mac:

- o Includes a URL Advisor feature that checks each website against Kaspersky's database of phishing sites and dangerous URLs - before you even open the website
- o Scans incoming and outgoing traffic - and assesses whether websites contain any malicious code that could infect your Mac

Preventing the theft of sensitive information, including your identity

Identity theft can be very lucrative for cybercriminals - but extremely inconvenient and costly for victims. Kaspersky Internet Security for Mac includes Kaspersky's Virtual Keyboard technology that:

- o Prevents keyloggers or identity thieves from intercepting your personal data
- o Lets you enter your personal and financial information onto web forms - without fear

Keeping your children safe online

The Internet hides many dangers - especially for children - so parental controls are an essential element in effective Mac security. Kaspersky Internet Security for Mac includes easy-to-use Parental Control technology that:

- o Protects children when they're online - surfing the Web, emailing, communicating via social networking sites, downloading files... and more
- o Helps you to manage and control how and when your children use the Internet - and how long they stay connected

Preserving more of your Mac's performance

Keeping your data, identity and children safe shouldn't be at the expense of your Mac's performance. Kaspersky Internet Security for Mac has been optimised to deliver Mac security with:

- o No noticeable impact on performance - whether you're surfing the Web or using your Mac offline
- o Quick and easy installation

Delivering rigorous Mac security that's easy to use, with a Mac-style interface

Because Kaspersky Internet Security for Mac has the 'look and feel' of a typical Mac app, it's very easy to use:

- o Major features and protection status are easily accessible
- o Fully supports the latest OS X versions - and all requirements of Retina display
